What We Need From You

Tirth Now · Accounts, files and decisions needed to go live — and how to get each one

Date: 20 October 2026

The golden rule: never paste secret keys or passwords into chat, email or WhatsApp. You put secrets directly into **Render** (for the server) or **GitHub → Secrets** (for app builds). Only non-secret things — files, links, decisions — are shared in chat.

How the hand-over works

Step	Who	What happens
1	You	Create the account (steps below).
2	You	Copy its keys into Render → *tirthnow-api* → **Environment** (or GitHub → Settings → Secrets and variables → Actions).
3	You	Tell us in chat: "Razorpay keys are added". No keys in the message.
4	Us	Switch that feature from test mode to the real service, test it and push.
5	Render / GitHub	Redeploys the server automatically; a new APK is built.

Until an account is added, that feature keeps running in **test mode** (OTP 123456, test payments), so the app can be demonstrated at any time.

Priority 1 — get the demo online (this week, no new accounts)

#	What	How to do it	Give it how
1	Fix the Render deploy	Render → open *tirthnow-db* → Settings → Delete. Same for *tirthnow-redis*. Then Blueprints → *tirthnow_fullstack* → **Manual sync**, then *tirthnow-api* → Manual Deploy.	If it fails: screenshot of the first red log line, in chat
2	Live API address	Shown at the top of the *tirthnow-api* page, e.g. `https://tirthnow-api.onrender.com`. Check `/healthz` shows `{"status":"ok"}`.	Chat (not secret)
3	Website address	Your Vercel project URL. Also put it in Render → Environment → `CORS_ORIGINS`.	Chat + Render
4	Point the app at the server	GitHub → repo Settings → Secrets and variables → Actions → **Variables** → New: `MOBILE_API_BASE_URL` = the API address. Then Actions → **Mobile APK** → Run workflow.	GitHub

Priority 2 — content and decisions

#	What	How to get it	Give it how
5	Logo as a vector file (SVG)	Ask your logo designer for the SVG / AI / PDF original.	Upload in chat
6	Photos: temples, hotels, restaurants	Own photos or licensed ones (do not copy from Google). At least 1 per place, landscape, 1600 px wide or more.	Upload in chat or a Google Drive link; name files by place, e.g. `banke-bihari-1.jpg`
7	Verified temple list & aarti times	We send you the current list; check each time with the temple office or its official notice board / website.	Mark corrections on the list we send
8	Legal pages: privacy policy, terms, refund & cancellation policy	We can draft them; a lawyer should review (Digital Personal Data Protection Act 2023). Needed by the app stores and Razorpay.	Approved text or links, in chat
9	Final app name & package ID	Currently `com.tirthnow.tirth_now`. It cannot change after the first Play Store upload — decide now (e.g. `com.tirthnow.app`).	Chat
10	Permission to clean one old commit message	Removes an AI link from the history; needs a history rewrite of the work branch.	Reply “yes, rewrite it”

Priority 3 — accounts for going live

Costs are approximate and change over time; check each provider's pricing page.

A. Firebase — real phone OTP login and push notifications

How to get it	What to give, where
1. Go to **console.firebase.google.com** → Add project "Tirth Now". 2. Build → Authentication → Sign-in method → enable **Phone**. 3. Add an Android app (package ID from #9) and an iOS app. 4. Project settings → Service accounts → **Generate new private key** (downloads a JSON file). *Cost:* free plan to start; phone OTP SMS may need the pay-as-you-go (Blaze) plan with billing.	**Chat (not secret):** `google-services.json` and `GoogleService-Info.plist`. **Render (secret):** from the private-key JSON → `FIREBASE_PROJECT_ID`, `FIREBASE_CLIENT_EMAIL`, `FIREBASE_PRIVATE_KEY`, and set `FIREBASE_AUTH_PROVIDER=firebase`.

B. Razorpay — real payments and vendor payouts

How to get it	What to give, where
1. Sign up at **razorpay.com** with the business PAN, bank account and GST (if registered). 2. Complete KYC (usually a few days). 3. Ask Razorpay support to enable **Route** (for paying hotels/vendors). 4. Settings → API Keys → generate; Settings → Webhooks → add `https://<api>/v1/payments/webhooks/razorpay` with a secret. *Cost:* no setup fee; about 2% per transaction.	**Render (secret):** `RAZORPAY_KEY_ID`, `RAZORPAY_KEY_SECRET`, `RAZORPAY_WEBHOOK_SECRET`, `PAYMENT_PROVIDER=razorpay`. **GitHub Variables (public):** `RAZORPAY_KEY_ID` only.

C. Google Play Console — publish the Android app

How to get it	What to give, where
play.google.com/console → sign up as an **Organisation** (needs a D-U-N-S number, free from Dun & Bradstreet, takes 1–4 weeks) or as an individual. Identity verification takes a few days. *Cost:* US$25 one time.	Invite us as a user with "Release" permission (Users and permissions → Invite), using the email we give you. The app signing key is created during the first upload.

D. Apple Developer — publish the iPhone app

How to get it	What to give, where
developer.apple.com/programs → enrol as an Organisation (also needs D-U-N-S). Building iOS also needs a Mac or a build service such as Codemagic. *Cost:* US$99 per year.	Add us in App Store Connect → Users and Access with the "App Manager" role. Signing keys go into Codemagic, not chat.

E. SMS — MSG91 + TRAI DLT (SOS alerts, booking SMS)

How to get it	What to give, where
1. Register the business as a sender on a **DLT portal** (Jio, Airtel or Vodafone Idea) — one-time fee of a few thousand rupees, approval takes days to weeks. 2. Register a sender ID (e.g. TIRTHN) and the SMS templates we give you. 3. Sign up at **msg91.com** and link the DLT entity ID. *Cost:* pay per SMS (paise per message).	**Render:** `MSG91_AUTH_KEY`, sender ID and template IDs; `SMS_PROVIDER=msg91`.

F. AI — Anthropic (Claude) and OpenAI

How to get it	What to give, where
console.anthropic.com → create an organisation → Billing (prepaid credits) → API Keys → Create. **platform.openai.com** → API keys (used only for search embeddings; very low cost). *Cost:* pay per use; set a monthly spend limit in each console.	**Render:** `ANTHROPIC_API_KEY` + `LLM_PROVIDER=anthropic`; `OPENAI_API_KEY` + `EMBEDDING_PROVIDER=openai`.

G. Google Cloud — maps, voice, temple photo recognition

How to get it	What to give, where
console.cloud.google.com (can be the same project as Firebase) → enable billing → APIs & Services → enable Maps SDK (Android/iOS), Routes API, Speech-to-Text, Text-to-Speech, Vision → Credentials → Create API key, and **restrict** each key to those APIs. *Cost:* free monthly usage, then pay per use.	**Render:** `GOOGLE_MAPS_API_KEY`, `GOOGLE_CLOUD_API_KEY`, set `MAPS_PROVIDER`, `STT_PROVIDER`, `TTS_PROVIDER`, `VISION_PROVIDER` to `google`.

H. Smaller services

Service	How to get it	Give it where
OpenWeather (live weather)	**openweathermap.org** → sign up → API keys. Free tier is enough.	Render: `OPENWEATHER_API_KEY`, `WEATHER_PROVIDER=openweather`
Cloudflare R2 + Stream (photos, reels)	**dash.cloudflare.com** → R2 → create 2 buckets (public, private) → R2 API token; Stream → API token.	Render: `S3_*`, `CF_STREAM_*`
WhatsApp Business (Meta)	**business.facebook.com** → verify business → WhatsApp Manager → add phone number → message templates.	Render: `WHATSAPP_PHONE_NUMBER_ID`, `WHATSAPP_ACCESS_TOKEN`
Email (Amazon SES or Postmark)	Sign up, verify your domain (add the DNS records they give you).	Render: `SMTP_*`
Sentry (error tracking)	**sentry.io** → create projects for api and mobile.	Render / GitHub: `SENTRY_DSN`

Domain name	Buy e.g. tirthnow.in (GoDaddy, Namecheap…). Point it at Vercel (website) and Render (api).	Tell us the domain in chat

Suggested order

When	Items	Why
This week	1–4, 9, D-U-N-S application	Demo online; D-U-N-S takes the longest
Next 2 weeks	Firebase, Razorpay, DLT registration, 5–8	KYC and DLT approval take days to weeks
Before launch	Play Console, Apple, AI keys, Google Cloud, OpenWeather, Cloudflare, domain	Needed for store builds and real features
After launch	WhatsApp, Sentry, email	Nice to have; test versions work meanwhile

Technical setting names for every item: `docs/CLIENT_SETUP_TODO.md` and `.env.example` in the repository.
